Calculate the given financial ratios in the subquestions based on the following information provided:

A company has the following financial statements:

Balance sheet:

Assets

Cash and cash equivalents: \$8 million

Accounts receivable: \$3 million

Inventory: \$5 million

Total assets: \$16 million

Liabilities

Accounts payable: \$1 million

Short-term debt: \$4 million

Long-term debt: \$6 million

Total liabilities: \$11 million

Shareholder's equity: \$5 million

Income statement:

Revenue: \$10 million

Cost of goods sold: \$6 million

Operating expenses: \$3 million

Net income: \$1 million

A company has built a ML-Based Fraud detection system and was testing it out in the test environment. During the experiment that they conducted for 15 transactions the following was observed:

Txn No.	ML System's Prediction	Ground Truth
1	Non-Fraud	Non-Fraud
2	Non-Fraud	Non-Fraud
3	Fraud	Fraud
4	Non-Fraud	Fraud
5	Non-Fraud	Non-Fraud
6	Non-Fraud	Non-Fraud
7	Non-Fraud	Fraud
8	Fraud	Fraud
9	Non-Fraud	Non-Fraud
10	Non-Fraud	Non-Fraud
11	Non-Fraud	Non-Fraud
12	Non-Fraud	Non-Fraud
13	Fraud	Fraud
14	Non-Fraud	Non-Fraud
15	Non-Fraud	Non-Fraud

Based on the above table which of the following statement is correct (consider the positive class as Fraud and negative class as Non-Fraud).

Options :

6406532335817. ✖ The system performs with a recall of 100%

6406532335818. ✔ The system performs with a precision of 100%

6406532335819. ✖ The system has 0 False Negatives

6406532335820. ✖ The system was calibrated to makes sure that it absolutely blocks all fraudulent transactions.

The following are the number of payments attempts on a regular day that a fintech giant is seeing in its platform. You are hired as a data scientist to find the pattern in the payment attempts and you decide to perform a MLE with a gaussian distribution as an assumption. Which of these correctly represents the parameters of the normal distribution based on MLE for the given data:

Daily Payment Attempts = 100, 145, 120, 250, 124, 364, 124, 237, 365, 143

Options :

6406532335821. ✖ $\mu = 95.18$; $\sigma = 12.6$

6406532335822. ✖ $\mu = 14.5$; $\sigma = 7.51$

6406532335823. ✔ $\mu = 197.2$; $\sigma = 101.18$

6406532335824. ✖ $\mu = 180.5$; $\sigma = 10237.5$

Which of the following is **not True** about using rules for Fraud Detection in the world of FinTech:

Options :

6406532335825. ✖ Rules can only be used for catching frauds that satisfy a set of pre-computed scenarios.

6406532335826. ✔ Rules can adapt very well to the changing fraud environment automatically.

6406532335827. ✖ Creating rules for detecting frauds is a very time-consuming process.

6406532335828. ✖ Rules do not scale well to capture wide range of fraud patterns.

Which of the following statement(s) is/are correct about isolation forest:

I. Isolation Forest is a tree based algorithm, so it is a supervised learning model.

II. In Isolation Forest the data points that are easy to separate from the population are more likely

to be anomalous.

III. Isolation Forest can be used only for fraud detection.

IV. Isolation Forest can be used only when the type of Fraud is known before building the ML system.

Options :

6406532335829. ✖ Statements I and II

6406532335830. ✖ Statements II, III and IV

6406532335831. ✖ Only statement IV

6406532335832. ✔ Only statement II

6406532335833. ✖ Statements I and IV

Question Label : Multiple Choice Question

When we do anomaly detection, a Univariate Gaussian distribution is a good choice for representing two features that are positively correlated?

Options :

6406532335834. ✖ True, since Univariate Gaussian distribution captures the interaction between variables well

6406532335835. ✖ False, since Univariate Gaussian distribution can only be used when the features are negatively correlated

6406532335836. ✖ True, since Univariate Gaussian distribution has a support from $-\infty$ to $+\infty$

6406532335837. ✔ False, since Univariate Gaussian distribution can only be used when the features are not correlated

As given in the confusion matrix of the classifier in Table 1, a bank provides loan to 300 prospects from a database. Selection of an actual good customer leads to an average profit of ₹12,000. Due to misclassification, if a bad applicant is selected for loan, an average loss of ₹40,000 will be incurred. Based on the data given in the confusion matrix (Table 1), what is the additional profit bank could have earned by giving loans to declined good customers?

Table 1

Classification confusion matrix		
Actual Class	Predicted Class	
	1	0
1	187	19
0	63	31

Options :

6406532335897. ✖ 22,44,000
