Calculate the given financial ratios in the subquestions based on the following information provided:

A company has the following financial statements:

Balance sheet:

Assets

Cash and cash equivalents: \$10 million

Accounts receivable: \$5 million

Inventory: \$3 million

Total assets: \$18 million

Liabilities

Accounts payable: \$2 million

Short-term debt: \$3 million

Long-term debt: \$5 million

Total liabilities: \$10 million

Shareholder's equity: \$8 million

Income statement:

Revenue: \$12 million

Cost of goods sold: \$6 million

Operating expenses: \$3 million

Net income: \$3 million

A company has built a ML-Based Fraud detection system and was testing it out in the test environment. During the experiment that they conducted for 15 transactions the following was observed:

Txn No.	ML System's Prediction	Ground Truth
1	Non-Fraud	Non-Fraud
2	Non-Fraud	Non-Fraud
3	Fraud	Fraud
4	Non-Fraud	Fraud
5	Non-Fraud	Non-Fraud
6	Non-Fraud	Non-Fraud
7	Non-Fraud	Fraud
8	Fraud	Fraud
9	Non-Fraud	Non-Fraud
10	Non-Fraud	Non-Fraud
11	Non-Fraud	Non-Fraud
12	Non-Fraud	Non-Fraud
13	Fraud	Fraud
14	Non-Fraud	Non-Fraud
15	Non-Fraud	Non-Fraud

Based on the above table which of the following statement is correct (consider the positive class as Fraud and negative class as Non-Fraud).

Options :

- 6406532333408. ✖ The system performs with a recall of 100%
- 6406532333409. ✔ The system performs with a precision of 100%
- 6406532333410. ✖ The system has 0 False Negatives
- 6406532333411. ✖ The system was calibrated to makes sure that it absolutely blocks all fraudulent transactions.

Question Label : Multiple Choice Question

When we do anomaly detection, a Univariate Gaussian distribution is a good choice for representing two features that are positively correlated?

Options :

6406532333425. ✖ True, since Univariate Gaussian distribution captures the interaction between variables well

6406532333426. ✖ False, since Univariate Gaussian distribution can only be used when the features are negatively correlated

6406532333427. ✖ True, since Univariate Gaussian distribution has a support from $-\infty$ to $+\infty$

6406532333428. ✔ False, since Univariate Gaussian distribution can only be used when the features are not correlated

As given in the confusion matrix of the classifier in Table 1, a bank provides loan to 300 prospects from a database. Selection of an actual good customer leads to an average profit of ₹12,000. Due to misclassification, if a bad applicant is selected for loan, an average loss of ₹40,000 will be incurred. Based on the data given in the confusion matrix (Table 1), what is the additional profit bank could have earned by giving loans to declined good customers?

Table 1

Classification confusion matrix		
	Predicted Class	
Actual Class	1	0
1	187	19
0	63	31

Options :

6406532333488. ✖ 22,44,000

6406532333489. ✖ 12,40,000

6406532333490. ✖ -2,76,000

What is the main advantage of using SHAP over other feature importance techniques?

Options :

6406532333505. ✖ SHAP is faster in computation

6406532333506. ✔ SHAP provides both global and local explanations

6406532333507. ✖ SHAP values are always positive, making interpretation easier

6406532333508. ✖ SHAP works only with linear models
