Which of the following best explains the difference between local and global explainability in machine learning models?

Options :

6406536025789. ✖ Local explainability is faster but less accurate, while global explainability is slower but more comprehensive

6406536025790. ✔ Local explainability focuses on explaining individual predictions, while global explainability aims to understand the overall model behavior across all data

6406536025791. ✖ Local explainability can only be applied to neural networks, while global explainability works for all model types

6406536025792. ✖ Local explainability requires the entire dataset, while global explainability needs only a single instance

Question Number : 29 Question Id : 6406531859705 Question Type : MCQ

Question Label : Multiple Choice Question

In SHAP (SHapley Additive exPlanations) analysis, what is the base value?

Options :

6406536025793. ✖ The highest prediction value that the model can produce

6406536025794. ✔ The average model output across the entire training dataset (expected value)

6406536025795. ✖ The prediction for a specific instance before feature contributions are added

6406536025796. ✖ The weighted sum of all feature values in the training set

Question Number : 30 Question Id : 6406531859706 Question Type : MCQ

Correct Marks : 1

Question Label : Multiple Choice Question

According to Shapley value theory, which of the following is a desirable property that SHAP explanations satisfy?

Options :

6406536025797. ✖ SHAP values are always positive and represent feature importance rankings

6406536025798. ✔ SHAP values satisfy the efficiency property: the sum of all feature contributions equals the difference between the prediction and the base value

6406536025799. ✖ SHAP values require the same computational time as LIME for any model

6406536025800. ✖ SHAP values can only be calculated for linear models

Correct Marks : 1

Question Label : Short Answer Question

A real estate developer offers an investment plan where buyers pay ₹15,00,000 upfront to own a property. The developer promises to pay ₹1,20,000 annually to the buyer for 20 years as rental income. However, some buyers propose an alternative: instead of a fixed rent, the annual rent should increase by 5% every year indefinitely. If the developer's cost of capital is 8%, what should be the rent in the first year of the new scheme so that it is financially equivalent to the original fixed-income plan?

Question Label : Multiple Choice Question

Two mutually exclusive projects have 3-year lives and a required rate of return of 10.5 percent. Project A costs ₹75,000 and has cash flows of ₹18,500, ₹42,900, and ₹28,600 for Years 1 to 3, respectively. Project B costs ₹72,000 and has cash flows of ₹22,000, ₹38,000, and ₹26,500 for Years 1 to 3, respectively. Using the NPV, which project, or projects, if either, should be accepted?

Options :

6406536025811. ✓ Reject both projects

6406536025812. ✗ Accept both projects

6406536025813. ✗ Accept Project A and reject Project B.

6406536025814. ✗ Accept Project B and reject Project A.
